Email Aliases

This settings page is only available to domain administrators.

An email alias is essentially a forwarding email address that can be used to forward messages to a single address or multiple email addresses. Aliases are most commonly used for departments or groups of individuals, like a small team of people working on a project or task.

For example, in a working environment with multiple email addresses, the office may want to make a central email address that distributes messages to all personnel. The alias `workplace@example.com` can be made for messages to be sent and then distributed to all of the employees.

To view a list of email aliases for the domain, click the settings icon . Then expand the Domain Settings folder and click Aliases in the navigation pane. A list of email aliases will load in the content pane.

To create a new email alias, click New in the content pane toolbar. To edit an existing email alias, click Edit in the content pane toolbar. The email alias settings will load in the content pane and the following options will be available:

- Name - The name of the alias. This name will be used to create the email alias address. For example, if you named the alias "info" and the domain was "example.com," the email alias address would be `info@example.com`.
- Disable greylisting - Select this option to disable greylisting for the email alias. In general, greylisting can be disabled for aliases that are used only for internal email. That is, mail that is sent within an organization and not from the general public.
- Enable live chat (XMPP) - Select this to allow the alias to appear as a contact in live chat. Enabling aliases for live chat means that instant messages can be sent to the alias from within webmail as well as when using third-party chat clients.
- Hide from Global Address List - Select this to keep the alias from appearing in the Global Address List.
- Email Address (One per line) - Type the full email address(es) of the users who should receive the messages sent to this alias.

Note: Even though an alias acts as an email address, users cannot login to an alias like they do a standard email address since no email is ever actually stored for the alias. Emails are just sent to the list of addresses provided for the alias.

A Note About Catch-All Aliases

A catch-all alias is simply that: an alias that catches all email sent to a domain that doesn't correspond to an actual account. Catch-all aliases can be useful as long as they are monitored and kept clear of unwanted email. However, due to the nature of email and the amount of spam that is sent every day, a catch-all can become a burden to email systems and to domain administrators. Therefore, it is suggested that they be used sparingly, or not at all if it can be avoided.
