List Serv Commands

List Serv Commands allow you to control the list through commands sent in email messages to the List Serv Command Address. By default, the command address for a domain is "STServ@example.com", where example is the name of your domain. Your server administrator may change this command address for you.

To send a command, compose an email to the command address with the command in the body of the message. The subject of the message is ignored.

Available Commands

Note: Any references to listname should be replaced with the list you are trying to use.

Help - Replies to the email with basic instructions on using List Serv Commands.

Help listname - Replies to the email with the contents of the Help E-Mail for that list.

List - Replies to the email with a list of all available lists.

List listname - Replies to the email with a list of all subscribers for a particular list. This command can be disabled by the moderator in List Settings .

Subscribe listname - Adds your email address to the subscribers list of the mailing list. This command may be disabled for private lists by the moderator in List Settings .

Unsubscribe listname - Removes your email address from the subscribers list for the mailing list referenced by listname.

Set mode digest listname - Sets your email address to receive emails in digest mode, which will send all messages for the list combined into one email at regular intervals.

Set mode standard listname - Sets your email address to receive emails in standard mode (the default), which will send messages one at a time to your email account.

Using a Catch-All

A catch-all alias can be established that can receive all incoming email that goes to invalid email addresses within your domain. You may want to do this, for example, if customers frequently send to accounts that do not really exist. In general, however, use of a catch-all alias is not recommended , as it makes you more prone to harvesting attacks.

To set a catch-all alias, first create an alias in your domain to be the catch-all. Then click the Settings button on the main toolbar and select Alias in the Accounts folder under the Domain Settings tree view. Click the Set Catch-All icon on the action toolbar and choose the alias you wish to use as the catch-all, and click on the Save icon from the actions toolbar.

Note: It is important to never set an auto-responder on an email account that the catch-all forwards to, as it may result in spammers sending more email to your domain. In addition, an increase in bandwidth usage will result. If you do not see the option for adding a catch-all, please contact your system administrator as they may have disabled the option.
