

Server Propagation

Help Documentation

Server Propagation

Use this section to apply Server Defaults to all of the servers in SmarterStats. System admins can opt to propagate all settings, or select individual settings to propagate. For example, if the Import Time of Day needs to change, admins can ONLY propagate that one change.

To access server propagation, click the SettingsX VS. Then expand the Defaults folder and click Server Propagation in the navigation pane. The default server settings will load in the content pane. To apply some or all of the default settings to all of the servers in SmarterStats, select the appropriate settings and click Propagate Now.
